Mouthpiece and Reed Setup

- · Most important part of assembly
- Take your time.
- Setup with plenty of light

Don't ever handle the tip of the reed. Always hold reeds at the thicker end to avoid damage

Step 1 - Wet the reed on both ends.

Wet the reed in your mouth for 15-20 seconds

Or, put your reed in a glass of water to wet it

Step 2 - Place Reed on Mouthpiece

Use the moisture on the reed to wet the table of the mouthpiece. This helps make an airtight seal.

Line up the reed carefully until it is perfectly centered on the mouthpiece.

Step 3 - Tighten Screw(s)

Once the ligature is perfectly centered on the reed, tighten up the screw enough to hold everything in place.

Step 4 - Suction Test

Optional: perform suction test to see if you've got a good seal.

Embouchure and Getting Your First Sound

Start with just the mouthpiece and neck

Top teeth in contact with top of mouthpiece

Bring corners of your mouth in. Your bottom lip will be between the reed and your bottom teeth

www.bettersax.com 3 of 10

Bottom lip should be bunched up and fleshy creating a firm yet relaxed cushion for the reed to vibrate on.

Good saxophone embouchure

The point at which the reed comes in contact with the mouthpiece is about how much of the mouthpiece should go into your mouth.

How to Put Together and Hold the Saxophone

Start by putting your neckstrap on

Grip the horn with your left hand

Insert neck tenon into body of sax with a gentle twist. Make sure tenon screw is loosened first.

www.bettersax.com 5 of 10

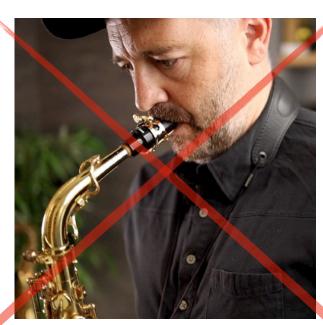

Align octave key mechanism with middle of neck

Grip sax with right hand

Adjust neck strap to bring the mouthpiece up to your top teeth while maintaining an upright posture.

Don't tilt your neck down to the mouthpiece

www.bettersax.com 6 of 10

The right hand thumb does **not** bear the weight of the saxophone.

Left hand thumb placed on the thumb rest where it can pivot to action the octave key.

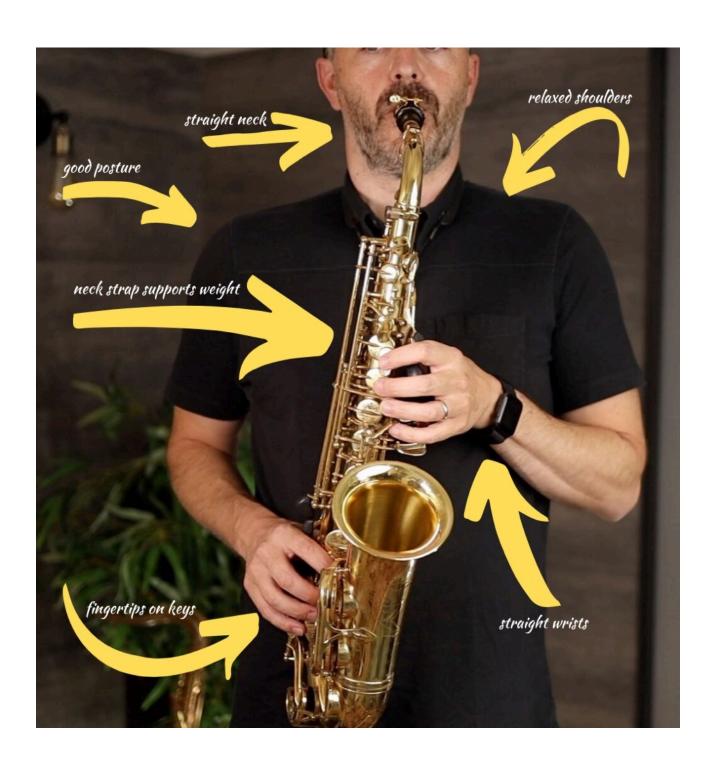

Right hand finger placement

Left hand finger placement
